ESSENTIALS is an excellent choice for companies that are starting with an ERP system to standardize their item and customer information and formalize their workflow. Essentials provides profit management through accurate cost and price reporting and eliminates error-prone, handwritten paperwork.

PICK & PACK provides integration points for equipment such as label printers, barcode scanners, and integrated scales to make breaking cases, labeling product, capturing catch weights and serial information more efficient. Food Connex Pick & Pack provides accuracy and speed with integrated label generation and barcode capture.

PRODUCTION PROCESSING automatically yields costs for cut or processed items and accumulates costs into recipe and bill of material items. Ingredients or items to be processed are scanned to a work order, and finished goods are labeled as they are placed on integrated scales. Each work order is compared to a template, and an alert announces if yields are out of acceptable deviations. Production becomes a real-time event by combining yield management and work orders with the cost and profitability visibility of Essentials and the accuracy and efficiency of Pick & Pack.

LOT CONTROL LOGISTICS adds an additional level to the features above and tracks inventory and costs by lot. Lots are carried through all steps of receiving, production, warehouse transfers, and sale. This allows for a single point of data entry for access to information about current stock status, historical stock movement, recall reports, and profitability to the lot level. Food Connex is a single, integrated package, so all benefits of the lower tiers carry into the next tier allowing for convenient upgrades without any disruptive systems changes.
